

Get Portfolio Views and Project Records (Plus Everything in Between) with **Kahua Analytics**

Project and portfolio analytics

Drill down into individual project details or roll up views across your entire program

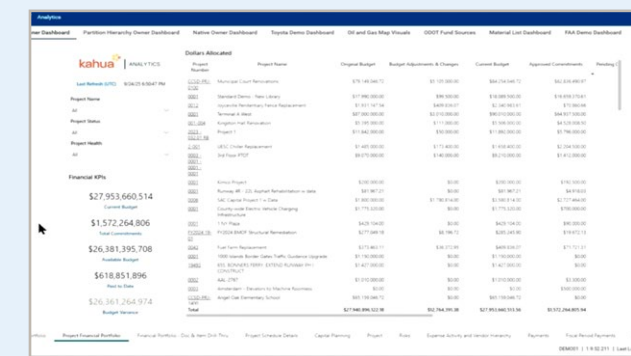

Stakeholders who need high-level program information from project data can view program or portfolio dashboards. Review information by projects and filter views by metrics that matter to their role.

Portfolio financials

Review project financials across your full portfolio

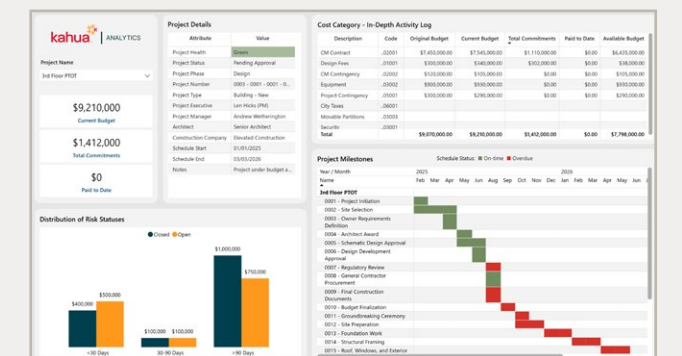

The portfolio-wide financial dashboard gives users a one-line view of project financials across the portfolio. Filter the dashboard and drill down to the source records and applications behind the numbers.

Project health details

See team, schedule, cost, and risk information for a specific project

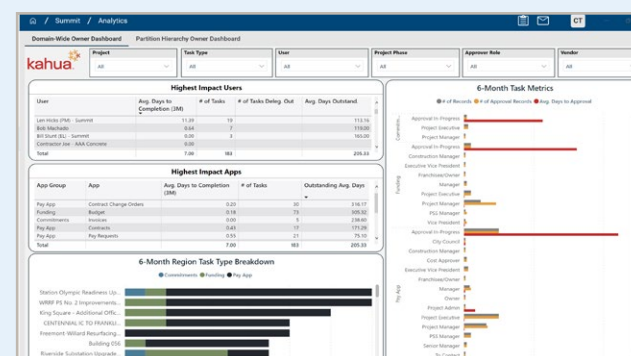

Once inside a project in Kahua Analytics, view or customize dashboards that bring key project details into view. Review project team, schedule, cost, and risk information in one place.

Workflow and business function views

Analyze specific project operations, not just overall status

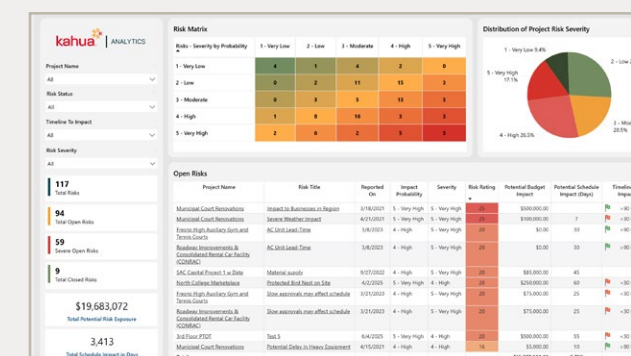

Kahua Analytics shows information tied to specific workflows or business functions across projects, or within a single project. Move between high-level dashboards and detailed operational views.

Risk register analytics

Filter high-risk projects

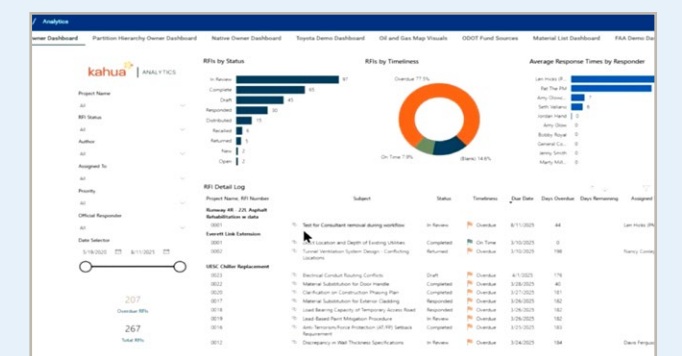

Kahua's risk register application tracks potential and actual project risks. For example, select the high-risk category in a pie chart to automatically filter dashboard widgets, showing high-risk projects.

RFI analytics

Identify response-time issues and workflow bottlenecks

RFI analytics shows average response times by project manager and RFI statuses across projects. See which RFIs are still in draft, awaiting response, or ready for review and closeout.

Move from data to insight to action with [Kahua Analytics](#).
